ABSTRACT

Online Aptitude Exam Generation system is a web based system. This System is smart enough to find the student level within short interval of time and to produce the accurate result. The main feature in this system is the concept of timer, timer is to be added to every question for analyzing the answer to set to the level of the paper. This system is proposed to deal with online objective type questions where the system analyze and studies the students answer depending upon the difficulty level and the time taken by the student to attempt that particular question. This system describes the conduction of online examination system for the objective type of exam. It also points out the way of attempting the question depending upon time taken .

ABSTRACT

Science and technology with all its fascinating advancements has been taking human life standards to the next level. The whole world will be literally jammed without these innovations. This project is an innovation, which makes the way of paying electricity bill simple compared to other existing projects. This project has been implemented using Java Swing as front end and MySQL as back end. The purpose of the project is to build an application program to reduce the manual work for managing the amount of units consumed by the customers and generating the electricity bill according to the type of customer – individual or commercial. It displays the details of the customers, units consumed by them and bill history. It enables them pay their bill if not paid. The date of payment will be updated while paying the bill. It maintains error free database and easily incorporates the future developments and changes.

ABSTRACT

This project is a web based shopping system for an existing shop. The project objective is to deliver the online shopping application into android platform. This project is an attempt to provide the advantages of online shopping to customers of a real shop. It helps buying the products in the shop any where through internet by using an android device. Thus the customer will get the service of online shopping and home delivery from his favorite shop. This system can be implemented to any shop in the locality or to multinational branded shops having retail outlet chains.

ABSTRACT

Inventory management system which is helpful for the business operators, where shopkeeper keep the records of purchase and sales. Mismanaged inventory means disappointed customers ,too much cash tied up in slower sale and warehouses .This inventory is eliminate paper work, human faults , manual delay and speed up process .This inventory management system will have the ability to track sales and available inventory, tells a shopkeeper when it's time to reorder and how much to purchase. Inventory management system is windows application developed for windows operating systems which focused in the area of inventory control and generate .The software is made up of two parts: The frontend is developed using Microsoft Visual basic 2010 and the Backend from SQL server Database 2008. Keywords: Database, Inventory, public, software.

ABSTRACT

With the advancement of technology, it is imperative to exalt all the systems into a user-friendly manner. The Library Management system (LMS) acts as a tool to transform traditional libraries into digital libraries. In traditional libraries, the students/user has to search for books which are hassle process and there is no proper maintenance of database about issues/fines. The overall progress of work is slow and it is impossible to generate a fast report. The librarians have to work allotted for arranging, sorting books in the book sells. At the same time, they have to check and monitor the lend/borrow book details with its fine. It is a tedious process to work simultaneously in different sectors. LMS will assist the librarians to work easily. The LMS supports the librarians to encounter all the issues concurrently. The users need not stand in a queue for a long period to return/borrow a book from the library. The single PC contains all the data's in it. The librarians have to assess the system and provide an entry in it. Through LMS the librarian can find the book in the bookshelves. The LMS is designed with the basic features such as librarian can add/view/update/delete books and students' details in it. Once he/she ingress into the system they can modify any data's in the database. The complete model is developed in Dot net technology, the C# language is used to build the front end application whereas the SQL server is exploiting as database.

ABSTRACT

“Employee Database And Payroll Management System” is designed to make the existing manual system automatic with the help of computerised equipment and full-edged computer software, fulfilling their requirements, so that their valuable data and information can be stored for a longer period with easy access and manipulation of the same. The required software is easily available and easy to work with. This web application can maintain and view computerised records without getting redundant entries. The project describes how to manage user data for good performance and provide better services for the client.

ABSTRACT

Now this is the age of speed. Everything happens in the speed of supersonic. The data can be transferred at the speed of light in the digital medium, can travel in the supersonic speed, hence there is a need of information inflow in the same speed. Here is one such need of information fast enough. We have experienced in waiting to a transport terminals for transport controllers to get the information about the transport facility. We encounter so many times there will be no person for providing these information which significantly wastes the time just to know whether there is any facility or not. Here is one solution for such a problem which lessens the human intervention in providing such information in the transport terminals.

ABSTRACT

The utility model discloses an SMS-based device monitoring a server remotely and processing failures in order to solve problems of the prior art that ports of different application services in the server cannot be monitored and a cell phone cannot be utilized for processing the failures remotely. The SMS-based device monitoring the server remotely and processing the failures includes a local area network, an SMS modem, a mobile network and a cell phone. The cell phone terminal is used for receiving alarm short messages and sending short messages to the to-be-monitored server through the mobile network and the short message modem and collecting states of the server and the services in real time through a monitoring program. When an abnormal state is collected, the monitoring program sends the alarm messages to the predetermined cell phone through an SMS platform and the SMS modem automatically by utilizing the mobile network. The SMS-based device monitoring the server remotely and processing the failures is not provided with a client terminal. The servers in the local area network can be monitored only through one service terminal. Therefore, the SMS-based device monitoring the server remotely and processing the failures provided by the utility model has characteristics of low cost, high practical applicability, convenient usage and the like.

ABSTRACT

Airline reservation System is a computerized system used to store and retrieve information and conduct transactions related to air travel. The project is aimed at exposing the relevance and importance of Airline Reservation Systems. It is projected towards enhancing the relationship between customers and airline agencies through the use of ARSs, and thereby making it convenient for the customers to book the flights as when they require such that they can utilize this software to make reservations.

This software has two parts. First is user part and the administrator part. User part is used as a front end and administrator is the back end. Administrator is used by airline authority. It will allow the customers to access database and allow new customers to sign up for online access. The system allows the airline passenger to search for flights that are available between the two travel cities, namely the "Departure city" and "Arrival city" for a particular departure and arrival dates. The system displays all the flight's details such as flight no, name, price and duration of journey etc. After search the system display list of available flights and allows customer to choose a particular flight.

ABSTRACT

The project concerns about how a cereals board buy farm products from farmers and also selling them farm inputs eg fertilizer and farm seeds. Problem statement. A cereals board requires a farmer to apply for a certain amount of fertilizer based on his/her farm acreage(this includes his/her land and the ones obtained through leasing. The amount of fertilizer applied should not exceed the recommended amount stipulated in the farm size per each individual farmer. The system should be able to notify the farmer that his/her application has been processed then he/she is given a go ahead to go and pay at the bank using the code sent to him and when should he/she pick her inputs after paying the bank should notify the cereals board automatically that so and so has paid certain amount of money using the specified code. The cereals board processes the payment and notifies the collector at the cereals port to dispatch certain amount of fertilizer to so and so, the system should also notify the farmer to pick his/her purchases at the collection point specifying the date and time. The system should also capture details of farmers selling the farm produce to the cereals board and when should the farmers receive the money from the sales.

ABSTRACT

The aim of this Online Hotel Management System project is to build a system that will be able to automate many operations in a hotel. Modern day hotels aim to create a user friendly atmosphere with the availability of concierges who remember frequent visitors and making it possible to call and make reservations. While such hotels are extremely expensive, such a service can also be provided in a cost – effective manner with the use of computers.

The process begins when a customer books a room, the booking can be placed online or through an Interactive Voice Response System (IVRS). The system will remember client preferences and can provide options accordingly. Once the room is booked, the visitor only needs to turn up and present identification. The system will also be able to send messages to the visitor's phone to remind them of restaurants they may have visited in the past and other options. The system can accept bookings for restaurants present in the hotel. Things – to – do around the locality can be advertised as well through messages.

ABSTRACT

The main aim of Apartment Management Mini DBMS project is to rent apartments and get payments from respective tenants. We aim to demonstrate the use of create, read, update and delete MySQL operations through this project. The project starts by creating a Owner and by adding details of tenant buying apartment. The owner provides building & apartment details to their tenant with the start date of rent. The tenants should pay their rents to the owner after every month completion.

ABSTRACT

In this scholarly thesis pertinent to the setting up of a automated student performance record management system which enables the users of a university like student and faculty to access the important information with ease through a user friendly web application. This proposed system aims at eliminating the practice of time consuming and vulnerable tradition of manual maintenance of student information in paper at the very basic level. In a university there are many departments all these departments provide various records regarding student. Most of these track records need to maintain information about the students. Thus by proposing a computerizes student record management system will enable the users to access data at any time and any place. The student web portal enables huge storage of data and easy retrieval. There are many departments in a college thus but introducing a student web portal will centralize the administration and the entire system will work as one single entity. The paper work would be reduced and number of workers in each department staff also reduces as one single operator can run this web application

ABSTRACT

An old method of keeping records of dairy members using pen and paper is not reliable as finding old data can take a long time. The Dairy Management System provides dairy owners an easy way to organize the data of dairy members in one place through a web application. Through the dairy management system, the dairy owner can keep records of the individual's daily milk collection and the same will be credited to the user's account so that both the owner and the user can keep track of past records. Also, the dairy owner gets a few more options in the dashboard. Only the owner can verify the user's account after the user registers in the system. With this, the owner can keep track of daily total collection, total revenue, total expenses, collection between two dates. Both the user and the owner can receive receipts from their account for milk related contributions and collection related transactions respectively.

ABSTRACT

The railway management system facilitates the passengers to enquire about the trains available on the basis of source and destination, booking and cancellation of tickets, enquire about the status of the booked ticket, etc. The aim of case study is to design and develop a database maintaining the records of different trains, train status, and passengers. The record of train includes its number, name, source, destination, and days on which it is available, whereas record of train status includes dates for which tickets can be booked, total number of seats available, and number of seats already booked.

ABSTRACT

The study investigated the relationship between Canvas learning management system, Google Classroom, Zoom for online teaching and quality of distance education. Purposive sampling technique was used to select 750 lecturers in 75 centers of Open University of Nigeria. Data was collected using Access Management and Quality of Distance Education Questionnaire. Pearson product moment correlation coefficient and linear regression analysis were used to analyze the data collected. The findings revealed that Canvas learning management system, Google Classroom and Zoom for online teaching were positive and significantly correlated with quality of distance education. It was recommended that lecturers should continue making use of canvas learning management system so as to helps students to plan the process of their learning. Also, lecturers should continue to adopt and implement the use of Google classroom to facilitate effective teaching and learning in order to provides learning opportunities by encouraging questions, exploration and outliers. Furthermore, lecturers should continue make use of zoom for online teaching so as to helps students to work in groups as well as helps students to collaborate both on the preparation and recording of the presentation through video conferencing in order to achieve quality of distance education in Nigeria
